DETAILED ACTION

Drawings

1. This application has been filed with informal drawings which are acceptable for examination purposes only. Formal drawings will be required when the application is allowed.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Suzuki et al. (U.S. Patent Number 4,859,360). Suzuki et al. discloses a liquid crystal time/temperature monitoring means that uses color changing as a means indication. In column 23 lines 11-41, there is an example of the device disclosed where this indicator is manufactured as a polymer film for coating on a surface, as in claim 3. The various areas of the film are sensitive to a particular color changing temperature. Figure 3 shows that the indicator device has numbers being made visible by said color changing, and this is further shown in figures 6-9. The device disclosed is capable to be adapted to indicate a number of indicating quantities depending upon application so long as the process for staying within the color-tolerance ranges of the indicator. The color tolerances determine which color is displayed and when. A good representation of the operation of the device is disclosed between column 17 line 6 and column 20 line 8.

In reference to claim 2, though there is no specific mention that this coating could be applied via paint, it is disclosed in column 23 lines 11-41 that the resulting solution is at some point a liquid, before the solvent is evaporated from it. While in liquid form, it would be possible to "paint" the solution onto a surface before evaporation. Also, it is well known to one of ordinary skill in the art a method of application of polymer films that is similar to "painting" onto a surface.

In reference to claims 4-6, one of ordinary skill in the art would be able to use such a device as disclosed by Suzuki et al. to indicate a variety of properties.

Conclusion
